proceedings of this conference which was held in perugia on april 22 30 1982 it was an opportunity for the developing of physical conceptions of all origins which may serve to throw light on the mysterious power of the quantum theory quantum mechanics has reached maturity in its formalism and although no experiment yet has come to challenge its predictions one may question the limits of its validity in fact the true meaning of this vision of the microphysical world remains the subject of endless debating at the heart of which lies the foundational myth of wave particle duality albert einstein and louis de broglie are the two discoverers of this fundamental duality which they always considered as a deep physical reality rather than a phenomenological artifice during the conference a survey has been given of the essential recent experimental results in corpuscular and quantum optics and the most up to date theoretical aspects of the specificity of microphysical phenomena various interpretations of quantum mechanics alternative theories and hidden parameters theories probabilistic and axiomatic questions and tentative crucial experiments the conference took place in the magnificent atmosphere of the villa colombella lent to us by the universita per stranieri di perugia

we are rarely asked to make decisions based on only one criterion most often decisions are based on several usually conflicting criteria in nature if the design of a system evolves to some final optimal state then it must include a balance for the interaction of the system with its surroundings certainly a design based on a variety of criteria furthermore the diversity of nature's designs suggests an infinity of such optimal states in another sense decisions simultaneously optimize a finite number of criteria while there is usually an infinity of optimal solutions multicriteria optimization provides the mathematical framework to accommodate these demands multicriteria optimization has its roots in mathematical economics in particular in consumer economics as considered by edgeworth and pareto the critical question in an exchange economy concerns the equilibrium point at which each of  $n$  consumers has achieved the best possible deal for himself or herself ultimately this is a collective decision in which any further gain by one consumer can occur only at the expense of at least one other consumer such an equilibrium concept was first introduced by edgeworth in 1881 in his book on mathematical psychics today such an optimum is variously called pareto optimum after the italian french welfare economist who continued and expanded edgeworth's work efficient nondominated and so on
